

Native and P3: per-step unions of all 1,024 boxes. Native ranges contain x_3 box bounds, not Flow* octagon geometry.
Huan/Xiangru: only $T=5$ endpoint hulls were saved, so no intermediate tube is drawn. Their endpoint intervals coincide.
 $[0.94, 1.06]$ is a $T=5$ target only. Adjacent outcomes are separate from ranges; no end-to-end NNCS proof or speed ranking.
