

Double Pendulum less robust: saved 225-box tube unions, four methods

Green denotes the visible part of Safe [-1.7,2]; its bounds extend beyond each cropped y-axis. Black segment: initial [1,1.3] at $t=0$.
 Each step unions 225 saved axis-aligned tube boxes. Huan and Xiangru bounds coincide; native acceptance is absent from ranges.bin.
 One run per method; box projection, not trajectories or an independent NNCS certificate.
