

NAV saved x/y tube union widths

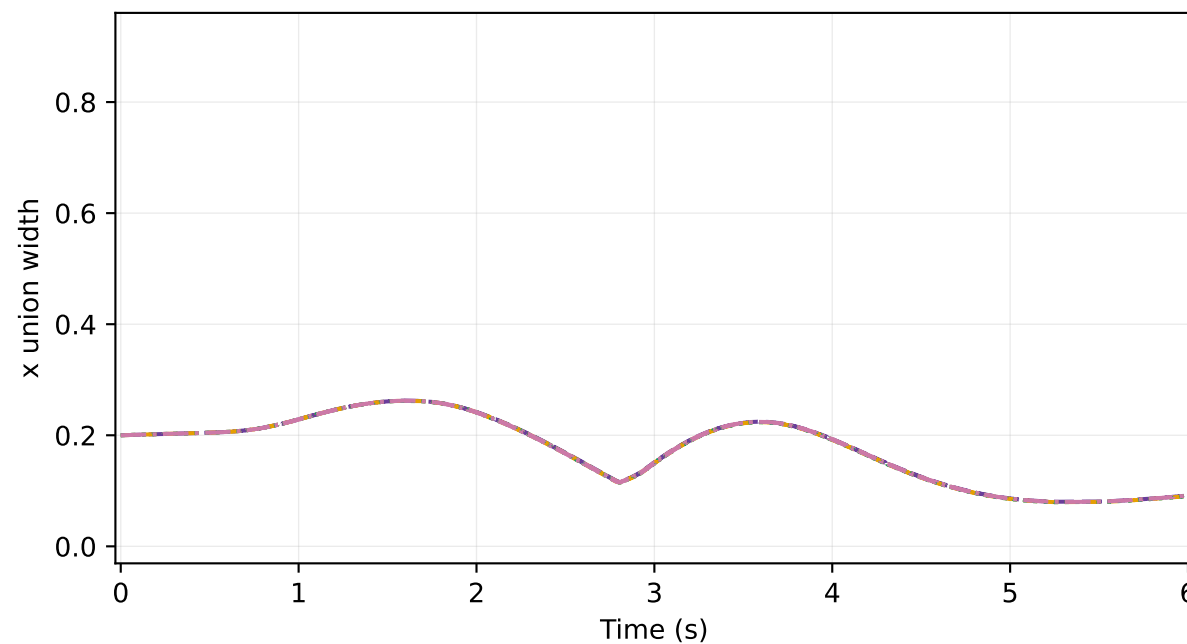

Standard: x

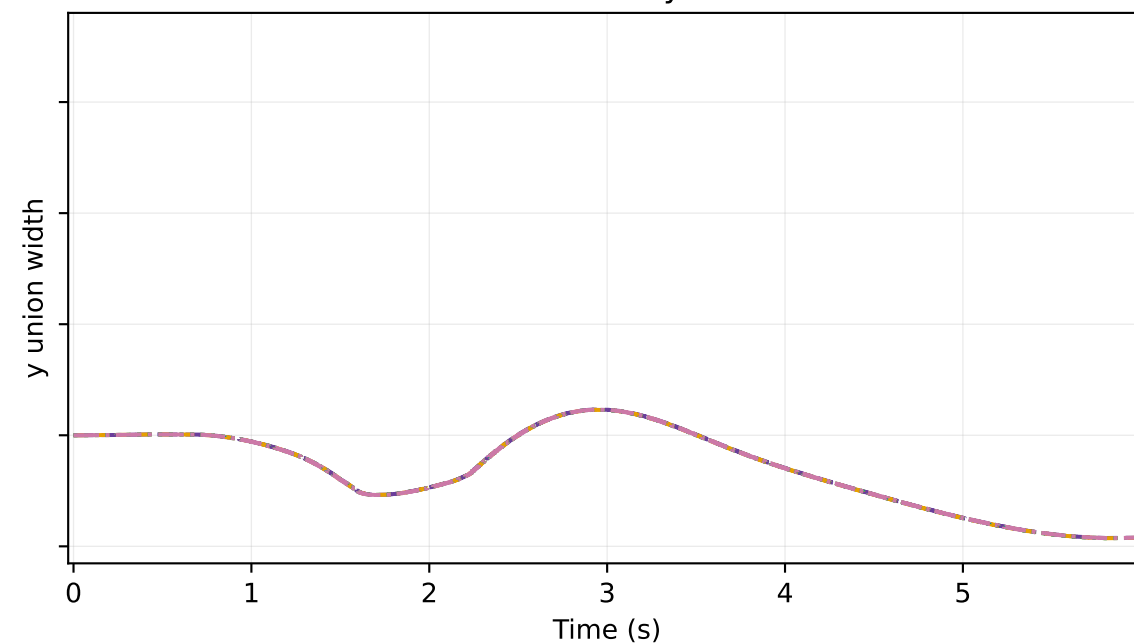

Standard: y

Robust: x

Robust: y

Current P3 is shown where supplied; Huan/Xiangru are historical. Standard native is new; robust native is historical.
 Old GPU ours appears only when no current P3 is supplied. Each tube spans its saved step; initial is $t=0$ and target only $T=6$.
 Obstacle shading is a one-coordinate projection of $[1,2]^2$; it does not decide joint avoidance. No proof or speed ranking.
